

Earth is the third [planet](#) from the [Sun](#) and the only [astronomical object](#) known to [harbor life](#). This is enabled by Earth being an [ocean world](#), the only one in the [Solar System](#) sustaining liquid [surface water](#). Almost all of Earth's water is contained in its global ocean, covering [70.8%](#) of [Earth's crust](#). The remaining 29.2% of Earth's crust is land, most of which is located in the form of [continental landmasses](#) within Earth's [land hemisphere](#). Most of Earth's land is at least somewhat [humid](#) and covered by vegetation, while large [sheets of ice](#) at [Earth's polar deserts](#) retain more water than Earth's [groundwater](#), lakes, rivers, and [atmospheric water](#) combined. Earth's crust consists of slowly moving [tectonic plates](#), which interact to produce mountain ranges, [volcanoes](#), and earthquakes. [Earth has a liquid outer core](#) that generates a [magnetosphere](#) capable of deflecting most of the destructive [solar winds](#) and [cosmic radiation](#).

Earth has [a dynamic atmosphere](#), which sustains Earth's surface conditions and protects it from most [meteoroids](#) and [UV-light at entry](#). It has a composition of primarily [nitrogen](#) and [oxygen](#). [Water vapor](#) is widely present in the atmosphere, [forming clouds](#) that cover most of the planet. The water vapor acts as a [greenhouse gas](#) and, together with other greenhouse gases in the atmosphere, particularly [carbon dioxide](#) (CO₂), creates the conditions for both liquid surface water and water vapor to persist via the capturing of [energy from the Sun's light](#). This process maintains the current average surface temperature of 14.76 °C (58.57 °F), at which water is liquid under normal atmospheric pressure. Differences in the amount of captured energy between geographic regions (as with the [equatorial region](#) receiving more sunlight than the polar regions) drive [atmospheric](#) and [ocean currents](#), producing a global [climate system](#) with different [climate regions](#), and a range of weather phenomena such as [precipitation](#), allowing components such as [nitrogen](#) to [cycle](#).
